

PROJECT REPORT

DISCORD BOT FOR GAMES RECOMMENDATION

CONCEPT NOTE

In this application user will get recommendation with the use of API like giant bomb API that will provide games information and data for all the newly launched games and can discuss with your gaming friends.

As we know discord is totally an online communication platform where you can talk with your friends and is basically designed for the gaming community where gamers can also stream their screen with their friends.

As discord is totally cloud based as we can't really run on our own private server, for that we need to connect to the public server.

It will gather the data using the API and then we'll use Discord API to send messages to a server with the game recommendations.

Literature Review

1. Anirudh Verma Et al [1] Developed a soviet bot which generate the information that are available on reddit.

2. Abhinand G Et al [2] developed bot named as KANMANI tool to help in productivity along with wellness parameters

3. Devin Robert Wright [3] Developed a bot for discord for the recording of student's attendance with legit data by knowing when a user leave and joined the channel and also without downloading any certain dedicated software for that.

Flowchart
